

ROTOR FOR A SPINNING REEL

ABSTRACT OF THE DISCLOSURE

A rotor of a spinning reel has a cylindrical portion, first and second rotor arms formed on oppose sides of the cylindrical portion, a bail arm pivotably mounted to the front ends of the first and second rotor arms for guiding fishing line to the spool, and a mounting member detachably installed on the outer peripheral side of the first rotor arm. The mounting member is detachably installed in a concave portion that is formed in the first rotor arm. A bail tripping device is mounted within the mounting member. In this manner, a bail tripping device for a rotor of a spinning reel can be interchangeable regardless of the size of the rotor.
